Chick Paper

# Chick Paper

This chick paper was developed by paper specialists in collaboration with different chick breeders. It is a special kind of paper, easily degradable with highly absorbing and rustling properties. Thanks to these features, one day old chicks in the brooding area are directed precisely (by the rustling sound) towards the drinking system.

When touched by chicks, the chick paper produces a rustling sound which attracts the animals. At the same time it constitutes a warm ground cover. Chick paper is deliberately produced at a width of 70cm and comes in rolls of 200 meters. The width has its importance for the following reasons:

- Too wide does not provide a good spread of the flock
- Too narrow the food would not be equally spread and the spillage would occur

The paper has to be unrolled under the drinking system. It can be used with drinking cups, nipples, columns, channels and minidrinkers. The paper proves its benefits from the very first moment when the chicks are distributed onto it.

Chick paper provides chicks in the brooding area with warmer ground cover than the classic bedding of concrete with litter. Thanks to this, cases of osteoporosis or yolk-remainder infections are minimised and business performance is increased.

Extensive experiments have shown that when using the chick paper the weight of each chick, after seven days, is improved by 10g.

After a few hours chicks find themselves on the paper over the entire poultry house. The water intake is optimised and also weaker animals can satisfy their needs.

The feed intake is improved by scattering the feed on the paper. The high absorbing capacity prevents chicks from eating secretions.

Chick paper has proven to be **highly degradable** so it is no longer necessary to remove the paper from the brooding area.

Chick paper is supplied in cartons containing two rolls of 200 meters. The rolls are wrapped in plastic foil.

### **Key Features**

- Quickly degradable in 3-5 days
- Time saving – no requirement to remove from building
- Improves productivity and uniformity
- Compatible with all drinking-water systems
- Warmer ground cover resulting in increased uniformity of the flock
- Better spread of the animals around the brooding area
- Highly degradable
